The integral on the right is an integral of one variable. Line integrals are not restricted to curves in the  $xy$  plane. If  $C$  is a curve in three dimensions parameterized by  $r(t) = \langle x(t), y(t), z(t) \rangle$  with  $a \leq t \leq b$ , then Example. Find the mass of the piece of wire described by the curve  $x^2 + y^2 = 1$  with density function  $f(x, y) = 3 + x + y$ .

### **Introduction to Line Integrals - Oregon State University**

From the viewpoint of differential geometry, the line integral of a vector field along a curve is the integral of the corresponding 1-form under the musical isomorphism (which takes the vector field to the corresponding covector field) over the curve considered as an immersed 1-manifold.

In this chapter we will introduce a new kind of integral : Line Integrals. With Line Integrals we will be integrating functions of two or more variables where the independent variables now are defined by curves rather than regions as with double and triple integrals. We will also investigate conservative vector fields and discuss Green's Theorem in this chapter.

In this section we will define the third type of line integrals we'll be looking at : line integrals of vector fields. We will also see that this particular kind of line integral is related to special cases of the line integrals with respect to  $x$ ,  $y$  and  $z$ .

A scalar line integral is defined just as a single-variable integral is defined, except that for a scalar line integral, the integrand is a function of more than one variable and the domain of integration is a curve in a plane or in space, as opposed to a curve on the  $(x)$ -axis.

integrals add up the volumes  $A(x)dx$  and  $a(y)dy$ . Notice the reversing of limits. Normally the brackets in (2) are omitted. When the  $y$  integral is first,  $dy$  is written inside  $dx$ . The limits on  $y$  are inside too. I strongly recommend that you compute the inner integral on one line and the outer integral on a separate line.
