Momentum, in this sense, is a vector that can be calculated by multiplying the mass of an object with its velocity (which is also a vector and the reason momentum is a vector as well). Its SI unit is kilogram meter per second, and it plays a crucial role in calculating the force from Newton's second law of motion, because the force is equal ...

In special relativity, four-momentum is the generalization of the classical three-dimensional momentum to four-dimensional spacetime. Momentum is a vector in three dimensions; similarly four-momentum is a four-vector in spacetime. The contravariant four-momentum of a particle with relativistic energy  $E$  and three-momentum  $\mathbf{p} = (p_x, p_y, p_z) = \gamma m \mathbf{v}$ , where  $\mathbf{v}$  is the particle's three-velocity and  $\gamma$  ...
