If the maximum frequency in your circuit is below 10 MHz, you may increase the value of R3 and R2 by the same factor (say R3=1.2 k, R2=56k) to save some current when using the counter in a battery-powered device. R1 sets the input impedance and also the sensitivity. ... Chetan (KG6NFG) built the counter with a single 4-digit module. Here are ...

Prescaler circuit IC1 and IC8, both dual 4-digit decade counters, form the divide-by-1000 prescaler circuit. The first thing to note here is that the MR line also drives the CPI-bar input (pin 12) of IC1b. This may look puzzling at first glance because IC1b doesn't appear to do anything. And that's exactly what it does — nothing!

In CRO we use $f=1/T$ formula to calculate frequency. Here also the same concept is used to calculate frequency. where. T is the time period of one cycle of signal in microseconds(us). In the program of Arduino Frequency counter we used $f=1000000/\text{pulseTotal}$.. Where. pulse Total is nothing but, a
