The traditional technique for gene cloning involves the transfer of a DNA fragment of interest from one organism to a self-replicating genetic element, such as a bacterial plasmid. This technique is commonly used today for isolating long or unstudied genes and protein expression.

Cloning a Gene by Tagging. Tagging is a cloning method that zeros in on the desired gene directly by inducing a mutation in that gene by using a specific piece of DNA as an insertional mutagen. The specific sequence is then used as a tag to recover the gene. The approach is summarized in Figure 10-16. One type of tag is transforming DNA.

The plasmid DNA is similarly referred to as cloned DNA, and this process of generating multiple identical copies of a recombinant DNA molecule is known as DNA or molecular cloning. The process of molecular cloning enabled scientists to break chromosomes down to study their genes, marking the birth of molecular genetics.

Addgene: Molecular Biology Reference

DNA cloning is a molecular biology technique that makes many identical copies of a piece of DNA, such as a gene. In a typical cloning experiment, a target gene is inserted into a circular piece of DNA called a plasmid.

Artificial gene synthesis or gene synthesis, refers to a group of methods that are used in synthetic biology to construct and assemble genes from nucleotides de novo.Unlike DNA synthesis in living cells, artificial gene synthesis does not require template DNA, allowing virtually any DNA sequence to be synthesized in the laboratory. It comprises two main steps, the first of which is solid-phase ...

Gene Cloning and DNA Analysis: An Introduction by T.A. Brown

When using a cloning vector, it is critical that the cloning vector and the desired gene both have the same restriction enzyme site. This allows for the creation of the same "sticky" DNA ends as shown in the video to allow for the gene to stick to the plasmid. It's also important that you know where this restriction enzyme is cleaving.

Transcription factor TFIID is a multiprotein complex composed of the TATA box-binding protein (TBP) and multiple TBP-associated factors (TAFs). TFIID plays an essential role in mediating transcriptional activation by gene-specific activators. Numerous transcriptional activators have been characterized from mammalian cells; however, molecular analysis of the components of mammalian TFIID has ...
