What is Multi-Protocol Label Switching (MPLS)? MPLS is a packet-forwarding technology which uses labels in order to make data forwarding decisions. With MPLS, the Layer 3 header analysis is done just once (when the packet enters the MPLS domain). Label inspection drives subsequent packet forwarding. MPLS provides these beneficial applications:

An MPLS network is commonly a backbone network comprised of MPLS-enabled routers called Label Switch Routers (LSR). Generally, the network consists of a core LSR with an edge LSR that applies labels to packets. This is the setup mechanism of an MPLS network: Routing tables of the different LSRs are computed with an Interior Gateway Protocol (IGP).
