And a pedigree is a way of analyzing the inheritance patterns of a trait within a family. And it can be useful to understand more about that trait, maybe to make some insights about the genetics of that trait, and it's a way to think about what's happened in the past in a family, and then maybe we can help get some probabilities or get some ...

### **Pedigrees (video) | Classical genetics | Khan Academy**

Answer Pedigree 1. • There are two affected siblings, a girl and a boy (black symbols) • The parents are relatives (consanguineous) as indicated by the double line drawn between the symbols of mother and father and the pedigree structure • The parents are not affected • This is horizontal transmission • Most probably the mode of inheritance is autosomal recessive • Both parents are carriers of the abnormal gene, although do not show any of the features of the disease ...

The answer of course is III-3. III-1 and III-5 each have a 1/2 chance of being a carrier but III-3 has almost a 0 chance of being a carrier. Why? Let's look at the Punnett Squares for X-linked recessive inheritance. In Pedigree above, II-2 and II-5 are both carriers, their father was affected and passed on his only X chromosome to his daughters.
